# ACETATE + GLUCOSE = METHANE INCREASE

---

## Digester $\text{CH}_4$ over time

# GOALS

---

## What affects methane production?

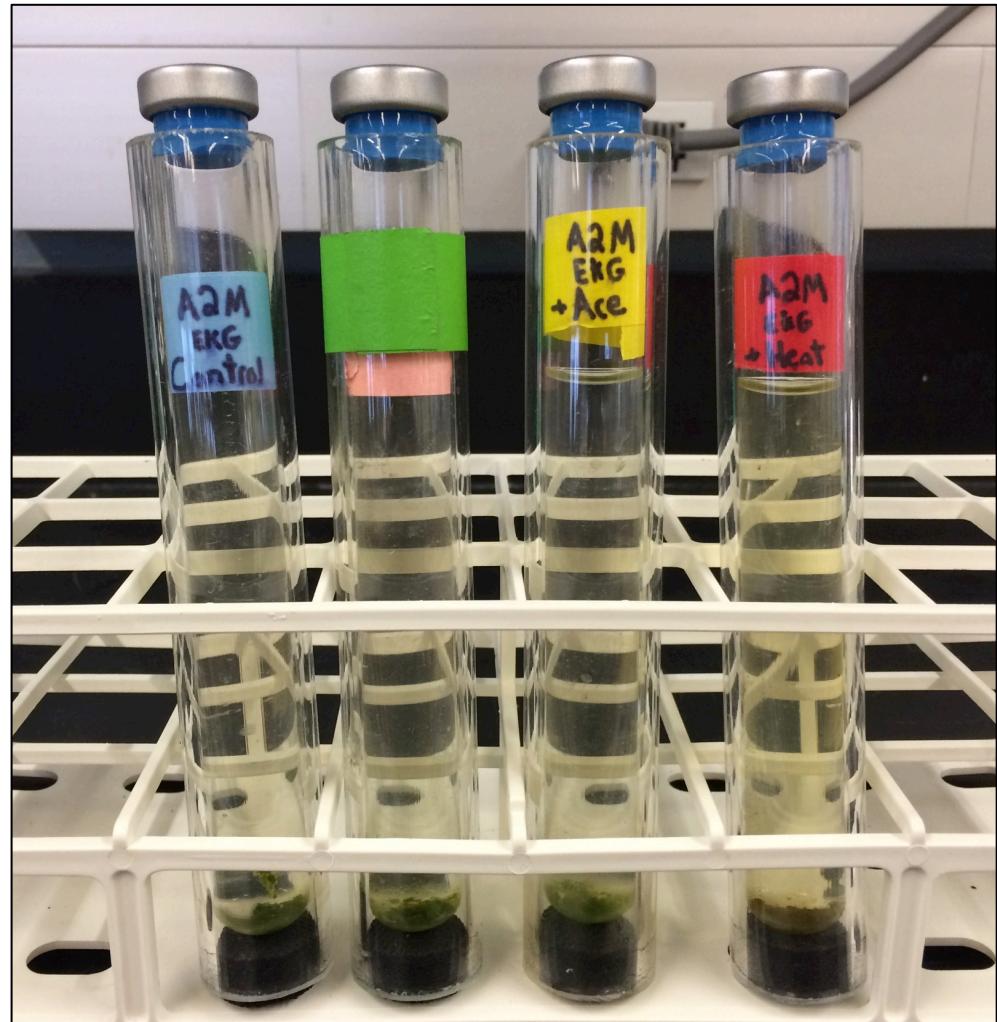

- H1: glucose stimulates decomposition and methane production (priming)
- H2: acetate stimulates methane production (direct)
- H3: autoclaving stimulates decomposition and methane production

# TREATMENTS

---

- 1** **CONTROL**
  
- 2** **GLUCOSE**  
(100 uM in 20mL)
  
- 3** **ACETATE**  
(100 uM in 20mL)
  
- 4** **AUTOCLAVE  
PRETREATMENT**  
(heat + pressure)

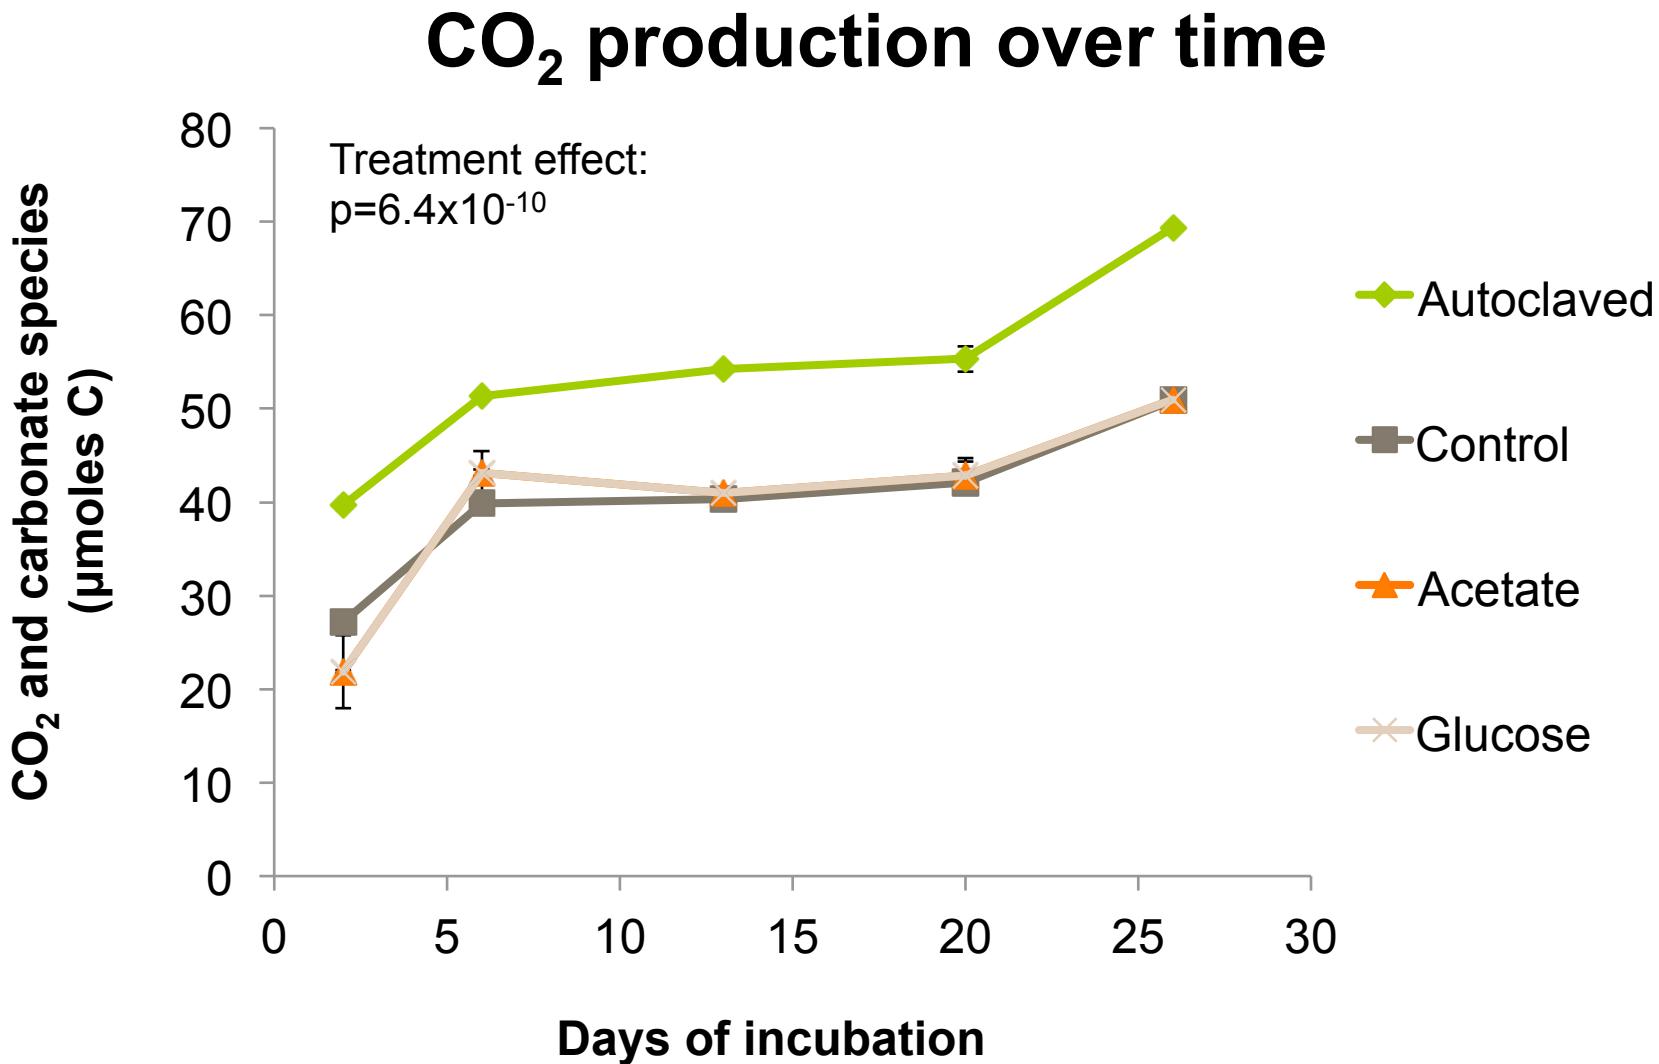

# Destructive Harvest

# INCUBATIONS

	Control	+Glucose	+Acetate	Autoclaved
2 <sup>nd</sup> day				
6 <sup>th</sup> day				
13 <sup>th</sup> day				
20 <sup>th</sup> day				
26 <sup>th</sup> day

# Methane

## Methane

## CO<sub>2</sub>

# CONCLUSIONS

---

**Trends show autoclaved could make more methane**

But not conclusive w/ 1 replicate

Autoclaved had more CO<sub>2</sub> – more decomposition

**Acetate and glucose don't make more methane**

Glucose & acetate inhibited methane production – VFA?

Opposite of results from previous experiment

Large effect for small amount added

**CO<sub>2</sub> plateaus and until last time point**

Methanogens using CO<sub>2</sub>

# FUTURE STEPS

---

**Pretreat algae before entering digester**

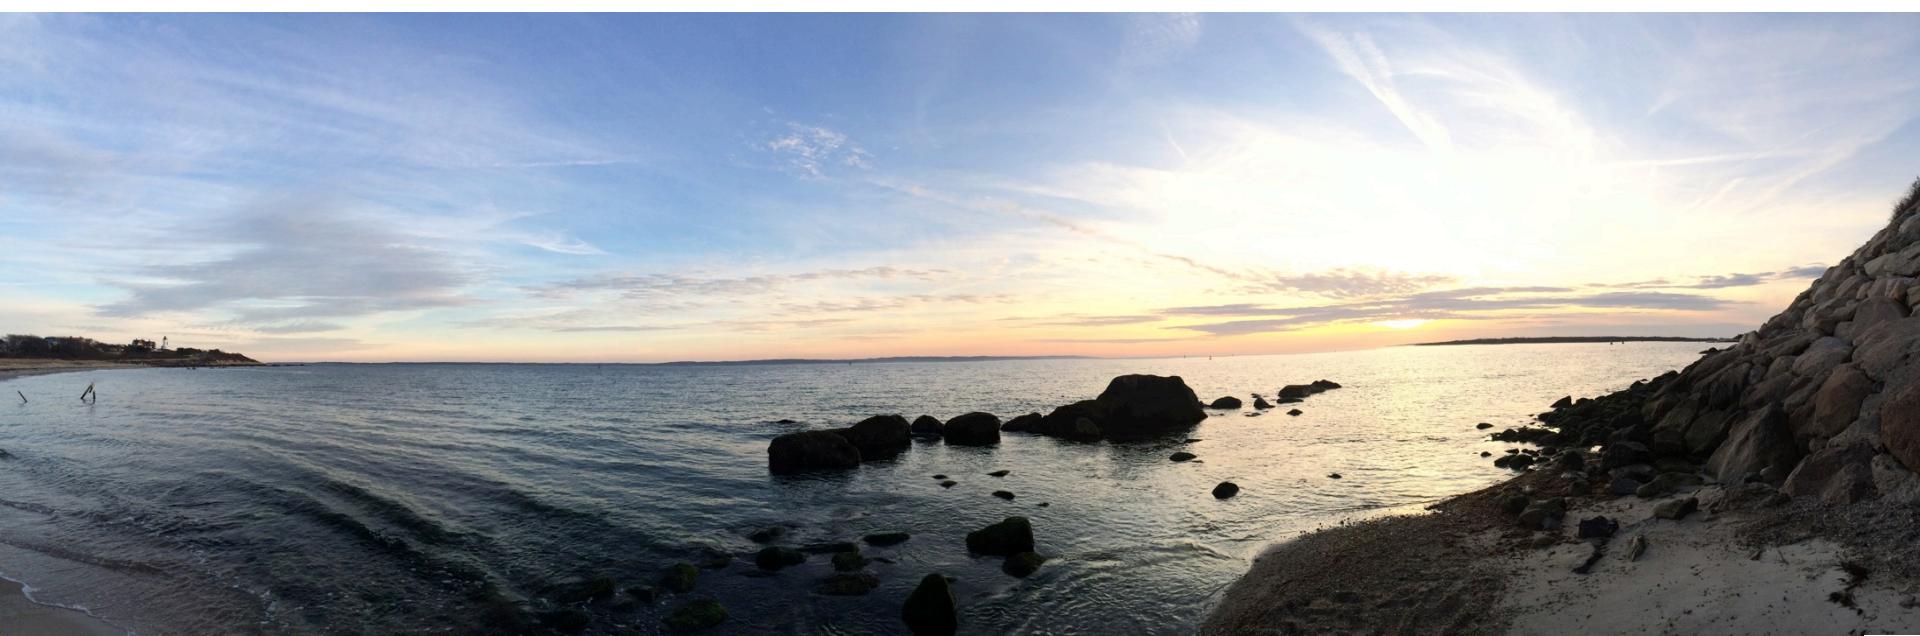

Heat or UV light

Make algae easier to use

**Possible source of energy production if perfected**

Self-sustaining
